

FACTSHEET

SEAL Systems Integration for SAP® PLM

BILL-OF-MATERIAL/WBS OUTPUT OF DOCUMENTS BY USING A BILL OF MATERIAL COLLECTION FUNCTION

// The transaction controlled document output using a order-related collection function enables secure identification of all DMS-administrated documents, e.g., of a production order. Filtering functions allows safe document distribution control.

The standard method, which can be controlled by parameters, substitutes customer-specific solutions and interactive list collections. Document distribution becomes faster, quicker, and more economical..

Bill-of-material/WSP

::: Identify and Output Documents

The module **DMS BOM** enables the automatic identification of documents assigned to a bill of material or a material and then outputs them through a document output management solution from SEAL Systems.

- The query for documents is initiated by entering values for different SAP objects (eg PSP element, material or customer order).
- The identification of documents can be filtered by using check boxes provided in the query dialog. Various methods of document assignment, identification and selection are supported.
- The output job is created automatically by using standard processes or by a dialog after the display of the document list. The job can be additionally edited or completed with further search in collection mode.

::: Integration

Integration:

- Transaction call
- Product structure browser
- Material search via class
- Project enhancements
- Batch call

Configurable Userexits:

- Document lists
- Output order
- Input check
- Entry variant
- Coverage layout

Output:

- Via SEAL Systems DOM
- All printers and plotters, all manufacturers, brands and models
- Electronically as file, e-mail, CD or via WEB
- All common document storage formats

::: Related Products

- DMS-PUR
Order: Identify/output documents
- DMS-PRO
Production order: Identify/output documents
- DMS-PM
Maintenance order: Identify/output documents

::: System requirements

- DMS-RPO2
DVS Repro
- DMS-BAPI
BAPI interface for DVS Repro
- PGP/PGR/PGV/gXn
PLOSSYS® Basic version or gXnetplot

::: Features

Object identification:

- PSP element
- Material number
- Usage
- Customer order

Control of the resolution of bill of material:

- Validity
- Level of resolution
- Change number
- Material status

Control of document assignment:

- Bill of material header
- Position typ
- Object linking
- Bill of material position

Filter functions for documents:

- Document typ
- Document status
- Highest version
- Only released documents
- Ignore duplicated

Output control

- Create new output job
- Use existing output job
- Create output job by dialog or use default settings
- Select collection mode
- Start preview mode
- View found document list immediately

::: Installation
